USCSP301 - USCS303: Operating System (OS) Practical – 02

Practical Date: 24 – 07 – 2021

Practical Aim: Non-Preemtive CPU Schedualing algorithm where each process with the smallest burst time is executed time.

CPU scheduling algorithm are used for scheduling different process present in the ready queue with available resource in an optimal way so that each and every process get execute by CPU

Scheduling algorithm are broadly classified into two main type namely preemptive and non-preemptive .

FIRST COME FIRST OUT(FCFS) is also know as FIRST IN FIRST OUT (FIFO) SCHEDUAL algorithm is the and simplest CPU .

A process scheduling different process to be assigned to the CPU based on particular scheduling algorithm .there are six popular process scheduling algorithm which we are going to discuss in this chapter FIRST COME FIRST OUT(FCFS) scheduling

Alogrithm :-

Step 1: Input the number of processes required to be scheduled using SJF, burst time for each process.

Step 2: Using enhanced bubble sort technique, sort the all given processes in ascending order according to burst time in a ready queue.

Step 3: Calculate the Finish Time, Turn Around Time and Waiting Time for each process which in turn help to calculate Average Waiting Time and Average Turn Around Time required by CPU to schedule given set of process using SJF.

> **Step 3.1:** for $i = 0$, Finish Time To = Arrival Time To + Burst Time T_0
>
> **Step 3.2:** for $i >= 1$, Finish Time T_1 = Burst Time T, + Finish Time T_{i-1}
>
> **Step 3.3:** for $i = 0$, Turn Around Time T_0 Finish Time T_0 - Arrival Time T_0
>
> **Step 3.4:** for $i >= 1$, Turn Around Time T_1 = Finish Time T_1 - Arrival Time T
>
> **Step 3.5:** for $i = 0$, Waiting Time To Turn Around Time T_0 - Burst Time T_0
>
> **Step 3.6:** for $i >= 1$, Waiting Time T_1 = Turn Around Time T_1 - Burst Time T_{i-1}

Step 4: Process with less arrival time comes first and gets scheduled first by the CPU.

Step 5: Calculate the Average Waiting Time and Average Turn Around Time.

Step 6: Stop

Step 2: Following shows the scheduling and execution of processes

    Step 2.1: At start P1 shortest execution time which is 0-3 second.

System time	0
Processes scheduling finish time	P1
Finish time	0+3=3
Wating time	3-3=0
Turn Around time	3-0=3

Step 2.2: next shortest execution time is for process P3 for duration 3-6 second.

System time	6
Processes scheduling finish time	P1,p3
Finish time	3+3=6
Wating time	6-3=3
Turn Around time	6-0=6

Step 2.3: Next job with shortest execution time is P4 for a duration 6-10 second.

System time	10
Processes scheduling finish time	P1,p3'p4
Finish time	6+4=10
Wating time	10-4=6
Turn Around time	10-0=10

Step 2.4: Next job with shortest execution time is p0 for duration of 10-16 second.

System time	10
Processes scheduling finish time	P1,p3,p3,p4,p0
Finish time	10+6=16
Wating time	16-6=10
Turn Around time	16-0=16

Step 2.5 : Similarly next job with shortest execution time is P2 for duration of 16-24 second.

System time	16
Processes scheduling finish time	P1,p3,p3,p4,p0,p2

Finish time	16+8=24
Wating time	24-8=16
Turn Around time	24-0=24

Step 3: Calculate average wating time and average turn around time.

> **Average wating time** = (0+3+6+10+16)/5
> = 35/5
> =7

> **Average turn around time** =(3+6+10+16+24)/5
> = 59/5
> =11.8
